3.3	London force / momentarily dipole forces/ dispersion forces \checkmark	(1)
3.4.1	In both pentane and 2-methylbutane there are <u>weak London/ dispersion forces</u> present. \checkmark 2-methylbutane is <u>more spherical / has a smaller surface area</u> than pentane \checkmark and therefore there are fewer/less intermolecular forces between its molecules and the <u>energy required to overcome the intermolecular forces in</u> 2-methylbutane is less than the energy required to overcome the intermolecular forces in the intermolecular forces in pentane. \checkmark therefore a lower boiling point \checkmark	(4)
3.4.2	2-methylpropan-2-ol have stronger hydrogen bonding between molecules \checkmark while pentane has weaker London/dispersion forces between its molecules. \checkmark Therefore more energy is required to overcome the IMF in 2-methylpropan-2-ol than in pentane. \checkmark And the more energy required the higher the boiling point. \checkmark	(4)
